EXPERIMENT – 1

Execution of rm, users and tree Commands in Kali Linux

1. AIM

To execute and understand the rm, users, and tree commands in Kali Linux, and to observe their outputs.

2. ALGORITHM / PROCEDURE

1. Open Kali Linux and launch the Terminal.
2. For the rm command, create a sample file using touch sample.txt and check it using ls.
3. Execute rm sample.txt to remove the sample file, then run ls again to verify that it is removed.
4. Execute the users command to display the usernames of users currently logged in.
5. If the tree command is not installed, install it with sudo apt install tree (on a system where package installation is permitted).
6. Move to a test directory and execute tree to display its folder and file structure.
7. Observe and record the output of each command.

3. COMMANDS AND DESCRIPTION

a) rm command

Command: rm sample.txt

Removes the specified file. Use it carefully because deleted files may not be recoverable from the terminal.

b) users command

Command: users

Displays the usernames of users currently logged in to the system.

c) tree command

Command: tree

Displays directories and files in a tree-like hierarchical format.

4. OUTPUT SCREENSHOTS

The following are illustrative terminal output screenshots for the lab record. Run the commands on your own Kali Linux system and replace these examples with your actual screenshots if required by your instructor.

a) rm command output

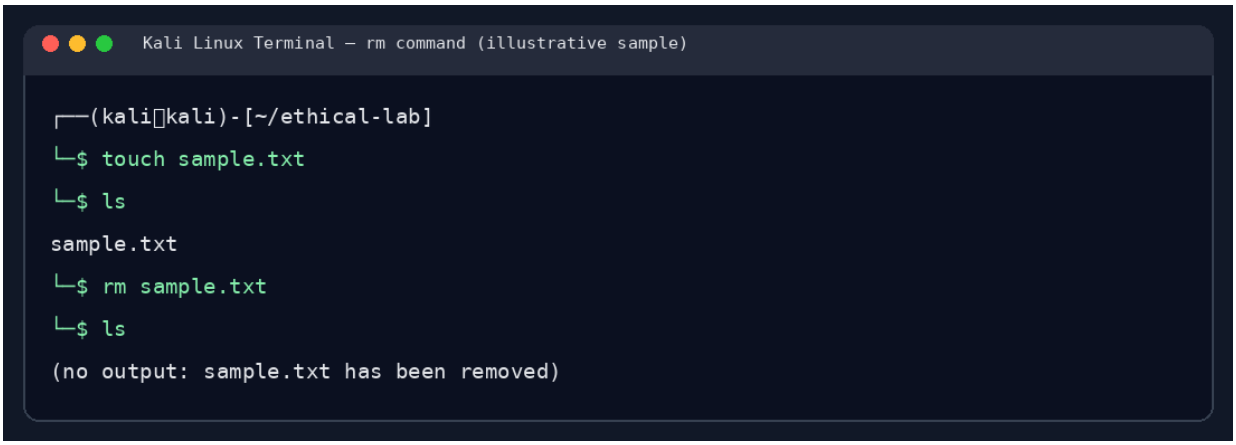

Figure 1: Sample output showing removal of sample.txt.

b) users command output

Figure 2: Sample output of the users command.

c) tree command output

Figure 3: Sample directory tree output.

5. RESULT

Thus, the rm, users, and tree commands were studied. The rm command removes a selected file, the users command displays currently logged-in usernames, and the tree command shows the directory structure in a hierarchical format.
